

CARELYNX Synthetic Discharge Packet

Sample healthcare document for testing document extraction, evidence linking, uncertainty detection, conflict detection, care-plan generation and human review.

Field	Value
Document Type	Hospital Discharge Packet
Patient	Rohan Mehta (SYNTHETIC)
Patient ID	CLX-DEMO-00427
Date of Birth	12 March 1968
Admission	05 October 2026
Discharge	07 October 2026
Preferred Language	Gujarati

1. Discharge Summary

Reason for admission: The patient was admitted for evaluation of intermittent chest discomfort and shortness of breath following physical exertion.

Hospital course: The patient underwent clinical assessment, routine laboratory testing, electrocardiogram (ECG), and chest imaging. The discharge note states that the patient remained clinically stable during observation. No acute finding requiring continued inpatient observation was documented in the discharge summary.

Documented discharge status: Stable for discharge according to the attending clinician's discharge note.

Documented instructions

- Continue the medications listed in the discharge prescription.
- Keep the scheduled outpatient follow-up appointment.
- Carry the discharge documents to the follow-up visit.
- Contact the treating healthcare facility if clarification of any discharge instruction is required.

Important source note

This packet is synthetic and intentionally contains one cross-document inconsistency for software testing. CARELYNX should identify the inconsistency rather than silently choosing a value.

2. Medication / Prescription Record

The following medication information is reproduced as documented in the synthetic discharge prescription. It is included for extraction testing only.

Medication	Strength	Documented frequency	Documented duration	Source
Cardiostat	20 mg	Once daily	30 days	Prescription p.1
Gastrocalm	20 mg	Once daily before breakfast	14 days	Prescription p.1
Relaxon	5 mg	At night	7 days	Prescription p.1
Vita-D3	60,000 IU	Once weekly	4 weeks	Prescription p.1

Prescription note

The prescription states: "Take medicines exactly as directed on this prescription. Do not alter dose or frequency without confirmation from the treating healthcare professional."

Potential OCR / extraction test

The original synthetic prescription intentionally contains a low-quality scan around the strength field for **Gastrocalm**. In the image version of this test packet, the final character may be visually degraded. CARELYNX should avoid guessing if OCR confidence falls below the configured threshold.

Medication reconciliation

The discharge summary and prescription should be treated as separate sources. If medication names, strengths, or frequencies differ between them, CARELYNX should display both source values and create a review case.

3. Follow-up Information

Item	Documented information	Source
Primary follow-up	Outpatient Medicine Clinic	Discharge Summary p.3
Follow-up date	14 October 2026	Discharge Summary p.3
Appointment time	10:30 AM	Appointment Sheet p.1
Bring	Discharge packet and recent reports	Discharge Summary p.3

Testing instruction: The follow-up date above is intentionally contradicted by the separate Appointment Sheet on page 5.

4. Laboratory Report

Specimen date: 06 October 2026 **Report date:** 07 October 2026

Test	Result	Unit	Reference range	Flag
Hemoglobin	13.8	g/dL	13.0–17.0	Within stated range
White blood cell count	7.4	10 ³ /μL	4.0–11.0	Within stated range
Platelets	248	10 ³ /μL	150–450	Within stated range
Sodium	139	mmol/L	135–145	Within stated range
Potassium	4.3	mmol/L	3.5–5.1	Within stated range
Creatinine	1.0	mg/dL	0.7–1.3	Within stated range
Glucose, fasting	104	mg/dL	70–99	Above stated range

Laboratory report note

Reference intervals shown above are reproduced from this synthetic laboratory report. The report itself does not provide a diagnosis based on these values.

CARELYNX extraction expectations

- Preserve numerical values and units exactly.
- Associate each value with its page/source.
- Do not turn a flagged laboratory value into an autonomous diagnosis.
- Do not recommend treatment based solely on laboratory values.
- If the patient asks for clinical interpretation beyond the source document, route the request to an appropriate healthcare professional.

5. Imaging / Investigation Summary

Chest radiograph: The synthetic report states that no acute pulmonary abnormality was identified on the submitted image.

ECG: The synthetic report states that an ECG was performed during observation. The report does not include a complete cardiology interpretation in this packet.

Source limitation

Because the complete ECG interpretation is not included, CARELYNX must not invent an interpretation from the fact that an ECG was performed.

Patient-facing summary candidate

“Your discharge packet contains laboratory and investigation reports. Some information is directly documented, while some clinical interpretation is not included. CARELYNX should show the available source information and identify missing interpretation rather than filling the gap with a generated diagnosis.”

6. Patient-Friendly Discharge Information

This page represents content that CARELYNX may generate from validated source facts. The wording is intentionally conservative and source-grounded.

Your documented next steps

- **Follow-up:** Your discharge summary documents an outpatient follow-up on 14 October 2026.
- **Appointment:** A separate appointment sheet contains appointment information. Because another document contains a different follow-up date, the date should be verified before being presented as final.
- **Documents:** Keep your discharge packet and recent reports available for the follow-up visit.
- **Medication information:** Medication details are listed in the prescription. CARELYNX should display them as documented and should not modify them.

When CARELYNX should ask a human to review

The system should create a review case when it encounters contradictory dates, uncertain medication text, incomplete clinical interpretation, or another field that cannot be reliably extracted.

Situation	Expected CARELYNX behavior
Two different follow-up dates	Show both sources and request human verification.
Unclear medication strength	Do not guess. Flag the field for review.
Missing ECG interpretation	State that interpretation is unavailable in the supplied documents.
Patient asks for diagnosis	Do not diagnose. Explain the limitation and direct the patient to a healthcare professional.
Patient asks to change medication dose	Do not recommend a change. Require clinician confirmation.

Language test

Preferred language: Gujarati

CARELYNX may translate validated patient-facing information into Gujarati. The translated version must preserve uncertainty labels such as “Needs review” and must not introduce new clinical claims.

7. Appointment Sheet — Intentional Conflict Test

Document type: Outpatient Appointment Confirmation

Field	Appointment Sheet Value
Patient	Rohan Mehta (SYNTHETIC)
Clinic	Outpatient Medicine Clinic
Appointment date	16 October 2026
Appointment time	10:30 AM
Location	Main Hospital, Outpatient Block B
Instruction	Bring discharge documents and recent reports.

INTENTIONAL CONFLICT

The Discharge Summary on page 2 states a follow-up date of **14 October 2026**. This Appointment Sheet states **16 October 2026**.

Source	Date	Status
Discharge Summary, p.2	14 October 2026	Conflicting source
Appointment Sheet, p.5	16 October 2026	Conflicting source

Expected CARELYNX behavior

- Detect the conflict.
- Display both dates.
- Link each date to its source document and page.
- Mark the result as CONFLICT_DETECTED / HUMAN_REQUIRED.
- Do not select 14 October or 16 October automatically.
- Create a review item for an authorized human reviewer.
- After review, record the decision and reason in the audit trail.

8. Synthetic Data / Testing Notice

This entire packet is fictional and created solely for software testing and demonstration. Names, identifiers, dates, medications, laboratory values, appointment information and clinical statements are synthetic. It must not be used for real-world medical decision-making.

Recommended automated test assertions

- ✓ At least one follow-up date is extracted from the discharge summary.
- ✓ The appointment sheet date is extracted separately.
- ✓ The date conflict is detected.
- ✓ The conflict creates a human-review case.
- ✓ No diagnosis is generated from the laboratory values.
- ✓ The incomplete ECG interpretation is not fabricated.
- ✓ Medication fields preserve source/page metadata.
- ✓ The patient-facing summary retains the uncertainty state.
